HÉCTOR TORAL

Pentester

Zaragoza, ES | **hectortoraltrabajos@gmail.com** | **hec7orci7o.github.io** | **github.com/hec7orci7o**

I am an engineer who has always been attracted to the world of cybersecurity. I am a restless person who is always looking for something to do. I have participated in different events, such as CTF and hackathons. Also, because I am a member of **codelabzgz** (student association), I have participated and organized some competitions and formative talks in programming languages such as Python. On the other hand, due to my interest and that of other students, we managed to encourage the creation of a **cybersecurity school** where a **professor** and PhD students introduce us to this world.

The last big event I have participated in is the **Locked Shields**, an event that tests your skills to defend national computer systems and critical infrastructures in case of real-time attacks. The focus is on realistic scenarios, cutting-edge technologies, and simulating the full complexity of a massive cyber incident, including strategic decision-making, legal, and communication aspects.

In addition, I have done some volunteering at my university, as an assistant in the **engineering and architecture week**, and participating in the **mentoring program** there.

And finally, after finishing my university degree, I have resumed training in cybersecurity through courses on the Hack The Box platform, TryHackMe and labs such as PortSwigger and Hack The Box.

WORK EXPERIENCE

NTT DATA

DevOps Student | Sep 2023 - Feb 2024

Development of my **bachelor's thesis** on the Knot platform, based on the platform engineering philosophy. The purpose of my work is to provide the platform with the basic capabilities for the automated management of serverless services lifecycle, making it easier for development teams to deploy and use.

During the course of my internship, I acquired skills for infrastructure deployment and orchestration using tools such as Terraform, Tekton, operators (Tekton and Flux), and CI/CD orchestrators such as ArgoCD. In addition, I became more familiar with the use of environments such as Kubernetes and integrations with external services for managing secrets.

NOLOGIN

Cyber Security Student | Jul 2022 - Ago 2022

During my university internship, I joined a cybersecurity team to help in the day to day duties in a company performing certain tasks such as:

- Generation of automatic alerts through the generation of **"QRadar"** SIEM use cases.
- Configuration and modification of rules in **Palo Alto Firewall** and analysis of the generated reports.
- Use of orchestrators in the field of cyber security, such as **Cortex XSOAR**.
- Automation of daily routine tasks.
- Execution and creation of internal phishing campaigns.
- Development of a platform to check which web pages are safe through integrations with other services such as Sodan, Virus Total, etc.

SKILLS

nmap, ffuf, gobuster, tcpdump, wireshark, hashcat, john, python, more in my **GitHub**

LANGUAGES

Spanish
Native speaker
